

Gob Servodistributor

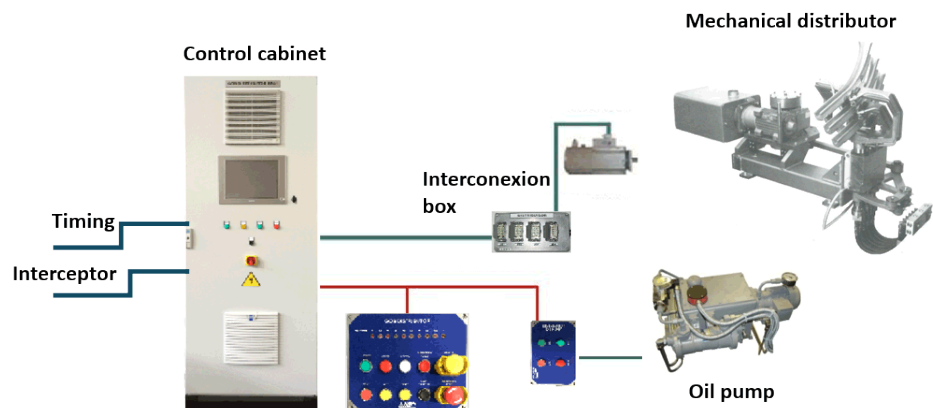

HSDG3000

Deliver the gob for each of sections.

Features and Benefits

- ✓ *Speed based on distance between sections.*
- ✓ *Low mechanical wear. Safe mechanics with torque regulation. Complies with European regulations.*
- ✓ *Compatible with all IS machine manufacturers.*
- ✓ *Living, continually evolving design open to improvement.*
- ✓ *Control of servo-motors, repetitive and reliable. Smooth movements.*

**Compatible.
Reliable.
Global Control.**

Reliable

The system calculates the acceleration and speed to move from one section to the next one based on the distance between those sections. This allows slow movements if the sections are next to each other, extending the life of the mechanisms. The movements are always done with an S shape acceleration, to decrease the effects of vibrations, and there is always a secure time used to assure the correct positioning of the distributor.

Compatible

The system is designed so that using digital signals the servo-distributor starts its movement. This allows complete compatibility with any kind of IS machine.

Safety

During position configuration manual secure movements can be done, allowing a secure way to position the distributor in its ideal position for each section.

Control.

Servodistributor.

Global control

Through the Global Control it's easy to configure the positions and times for the movements. A graphical interface allows an easy configuration.
